*Thin Stone Veneer* is the sawn facings of traditional "full bed" building stone veneer. Whereas traditional building stone veneer typically ranges in thickness (depth) from 3" to 5" and requires a bearing shelf, thin veneer products vary in thickness between  $\frac{3}{4}$ " and  $1\frac{1}{4}$ " and do not require any special foundations. 90° angle cuts taken from the interior of full bed cutting stock produce thin veneer corners that help conceal the overall material depth.

Thin veneer stone installs quickly and easily over a wide variety of substrates allowing for greater versatility in installation.
